OVERVIEW

Showcase your most impressive accomplishments right here. Within seconds, the reader should be able to tell who you are and what your areas of expertise are. The purpose of a professional profile is to provide a quick overview of your potential skills, experience, and achievements to a recruiter without requiring them to read the rest of your resume.

EXPERIENCE

Full Stack Software Engineer

JETCharge, Melbourne | Oct 2021 – Jun 2026

CORE – EV Energy Management System

- Co-designed and led the frontend for a greenfield, first-in-Australia edge system letting non-specialist electricians commission a site without touching a config file. Fits up to 5x more chargers per power supply, unlocking uneconomic sites (apartments, fleet depots).
- Built a real-time local dashboard (WebSocket streaming, REST APIs) for instant on-site fault diagnosis, replacing manual charger/meter checks.
- Re-architected the legacy monolith into a modular monolith and ported the comms layer to JET Charge's cloud, cutting effort to add message types.

Illuminate – EV Charging Asset Management Platform

- Engineered partner/contractor management for third parties to manage assets across organisations (dealer-style network). Opened training/subscription revenue, backs Australia's largest EV operators (Woolworths, Team Global Express, RACV, SG Fleet).
- Refactored the core DB permission layer to centralise access control, removing duplicate checks and developer-error risk.
- Uplifted the legacy UI to a modern React component system, speeding delivery.

Zero-Touch Configuration (ZTC) – Remote CORE Commissioning

- Designed and led ZTC (React Node-UI & secure .NET cloud services) preconfiguring chargers before shipping. Removed on-site visits; cut commissioning from hours to minutes.
- Built a config sync engine with push/pull and drift/conflict detection that recovers from network drops and prevents invalid states.
- Added a config pointer table & caching layer, cutting repeated-query times under 3s and cloud costs.

EDUCATION

Compute and Network Engineering

RMIT

Mar 2016 – Mar 2020

SKILLS

- .NET, C#, SQL
- React, Typescript
- Azure, Bicep, Github Actions, Azure Devops

Billing – Apartment & Commercial Charging

- Led Stripe integration into a legacy .NET platform: private chargers billed per resident, shared chargers per session, with automated quarterly Owners Corp reimbursement. Unlocked hundreds of thousands in recurring revenue.
- Exposed billing APIs to the JET Charge Connect app, letting residents self-manage usage and payments.

IT Specialist

EnergyLocals, Melbourne | Sep 2020 – Oct 2021

Customer Portal & Identity Verification

- Built the company's first white-labeled customer onboarding platform (Bootstrap & Laravel) with automated database provisioning. Replaced manual setup and enabled self-serve, high-volume sign-ups with no per-customer engineering effort.
- Integrated Westpac and Equifax KYC verification, the company's first automated identity-verification flow. Met utility-sector regulatory requirements while removing a manual review step.

Data Engineering & Systems Operations

- Designed C#/SQL ETL pipelines consolidating operational and compliance data into a single source. Replaced ad-hoc manual consolidation.
- Administered high-availability VPS hosting core operational databases. Established the monitoring and patching protocols the team ran on.
- Automated infrastructure and dev-workstation provisioning. Turned a manual, error-prone setup into a repeatable script and standardised engineer onboarding.

Graduate IT Specialist

EnergyLocals, Melbourne | Sep 2019 – Oct 2020

AEMO Market Management System (MMS) Settlements

- Engineered C# programs and SQL procedures to reconcile AEMO national electricity market settlement data. Ensured audit compliance and reconciliation accuracy across the company's market-facing financials.
- Built the ETL pipelines pulling grid pricing, demand, and network-load telemetry from AEMO MMS. Established the company's reporting and analytics data foundation.

Systems & Infrastructure Automation

- Designed automated backup and disaster-recovery pipelines for critical databases. Replaced manual backups and cut recovery risk.
- Automated provisioning scripts for technical workstations. Made engineering setup repeatable instead of hand-configured.
